Title: Predictive modelling applications in actuarial science- Vol II: case studies in insurance edited by Edward W Frees, Glenn Meyers and Richard A Derrig

Publisher: Cambridge University Press
Year of publication: 2016
III library accession no.: B7744

Description of the book –

Predictive modeling uses data to forecast future events. It exploits relationships between explanatory variables and the predicted variables from past occurrences to predict future outcomes. Forecasting financial events is a core skill that actuaries routinely apply in insurance and other risk-management applications. Predictive Modeling Applications in Actuarial Science emphasizes life-long learning by developing tools in an insurance context, providing the relevant actuarial applications, and introducing advanced statistical techniques that can be used to gain a competitive advantage in situations with complex data. Volume 2 examines applications of predictive modeling. Where Volume 1 developed the foundations of predictive modeling, Volume 2 explores practical uses for techniques, focusing on property and casualty insurance. Readers are exposed to a variety of techniques in concrete, real-life contexts that demonstrate their value and the overall value of predictive modeling, for seasoned practicing analysts as well as those just starting out.

Contents –

1. Pure premium modeling using generalized linear models
2. Applying generalized linear models to insurance data: frequency/severity versus pure premium modeling
3. Generalized linear models as predictive claim models
4. Frameworks for general insurance ratemaking: beyond the generalized linear model
5. Using multilevel modeling for group health insurance ratemaking: a case study from the Egyptian market
6. Clustering in general insurance pricing

7. Application of two unsupervised learning techniques to questionable claims: PRIDIT and random forest
8. The predictive distribution of loss reserve estimates over a finite time horizon
9. Finite mixture model and workers' compensation large loss regression analysis
10. A framework for managing claim escalation using predictive modeling
11. Predictive modeling for usage based auto insurance
